

can you build the go to market agency referenced in this chat?

https://chatgpt.com/g/g-p-6a804d397b588191820a914842acb698-giveago/shared/c/6a80670c-fd68-83eb-9ada-08879da5ae8f?owner_user_id=user-mc7JpJ8ZD9c5Dx4jHqPEs6q2

Yes. I can build the **Go-to-Market Agency** described in that conversation.

I can access the shared-chat URL itself, although ChatGPT isn't exposing the conversation contents to my browser tool.  ChatGPT Based on the project context you've already established, though, I can reconstruct the architecture and build it out with you.

The key idea I'd recommend is **not simply an "ad copy generator."** It should behave like a small AI GTM agency: strategy in → campaign system → human approval → production-ready assets → learning loop.

The agency I'd build

1. GTM Brief Intake

Input:

- GTM brief
- GTM strategy
- ICP/personas
- positioning
- offer
- proof points
- brand guidelines
- campaign objective
- budget/channel constraints

The agent first turns this into a **Campaign Source of Truth** rather than immediately generating ads.

That is important because a good GTM brief needs to establish audience, goals, core message, channels and evidence before execution.  discover.gtmpla... +1

2. Campaign Strategist

Drag to the strategist Update
Close

- campaign objective
- primary audience
- secondary audiences
- buying triggers
- pain/problem
- desired outcome
- proposition
- core campaign idea
- message hierarchy
- proof/evidence
- CTA
- channel strategy
- creative territories
- things we're explicitly **not** going to claim

It produces something like:

Campaign idea: "Don't hire the gap. Fill it."

Then derives multiple creative territories from that idea.

3. Asset Planner

This is where your original idea gets much more powerful.

Rather than asking:

"Create some LinkedIn ads."

the system creates an **asset matrix**.

For example:

Channel	Asset
LinkedIn	5 static ads
LinkedIn	3 carousel concepts
Meta	5 image ads

Channel	Asset
Google	Search ad set
Email	3-email campaign
Podcast	30-sec host-read
Social	10 posts
Billboard	3 concepts
Digital signage	3 concepts
Landing page	Hero + supporting copy
Sales	Outreach sequence
Video	3 short-form concepts

This is consistent with how real GTM asset systems are structured: one strategic narrative cascades into multiple channel-specific executions.  GTM Assets +1

4. Creative Director

This should be a separate agent/persona.

It takes the campaign strategy and develops:

Creative territories

1. Problem-led
2. Outcome-led
3. Contrarian
4. Proof-led
5. Emotional
6. Product demonstration

For each:

- headline
- visual concept
- composition
- imagery

- copy
- CTA
- rationale
- target audience
- channel suitability

And crucially, it understands that a **billboard is not a LinkedIn ad with the dimensions changed.**

A billboard might need:

STOP HIRING FOR THE GAP.

while the supporting digital campaign could explain:

Access fractional AI expertise without adding another permanent headcount.

5. Copy Agent

Then we have channel-specific execution agents.

For example:

Paid social

- hooks
- primary text
- headline
- CTA
- variants

Search

- headlines
- descriptions
- keyword/message alignment

Email

- subject lines
- preview text
- body
- CTA

Podcast

- host-read script

- 15/30/60 second versions

Out-of-home

- headline
- subhead
- CTA
- visual direction

Social

- post
- hook
- image/video direction

6. Visual Creative Agent

This is the part I think we should make a major feature of GiveAGO.

It doesn't just say:

"Create an image."

It generates a **production brief** first:

CAMPAIGN

Don't hire the gap.

AUDIENCE

CFO / COO

100-500 employee businesses

FORMAT

48-sheet billboard

MESSAGE

Avoid permanent headcount while accessing specialist AI capability.

VISUAL CONCEPT

An empty office chair labelled "Full-time employee"
next to a compact AI-powered specialist team.

HEADLINE

DON'T HIRE THE GAP.

SUPPORT

Get specialist AI capability when you need it.

CTA

Then the image-generation system can actually produce the visual.

That gives you a clean separation between **strategy** → **creative direction** → **generation**.

7. Human Creative Director / Approval Gate

This is essential.

The system shouldn't autonomously publish everything it creates.

I'd make every campaign go through:

GENERATED → **REVIEW** → **APPROVED** → **PRODUCTION**

The human reviewer sees:

- strategic rationale
- target audience
- claim/evidence
- copy
- visual
- format
- channel
- CTA
- compliance warnings
- confidence score

And can say:

| Approve

or:

| Change headline

or:

| Too corporate

or:

| This claim isn't supported

The agent then revises **only the relevant parts** rather than regenerating the entire campaign.

8. QA Agent

Before anything reaches production, a separate agent checks it.

I'd give it roughly six dimensions:

Strategic QA

- Is it aimed at the right ICP?
- Does it reflect the GTM strategy?

Message QA

- Is the proposition clear?
- Is the CTA appropriate?

Evidence QA

- Are claims supported?
- Has the AI invented proof?

Brand QA

- Tone
- terminology
- visual rules

Channel QA

- character limits
- dimensions
- safe zones
- required components

Conversion QA

- Is there a reason to act?
- Is the next step clear?

This is important because the best GTM systems explicitly connect **claim** → **proof** → **audience** → **format** → **action** rather than producing disconnected creative. 

The resulting architecture

I'd structure GiveAGO roughly like this:

And I'd make the Campaign Source of Truth the heart of it

Every asset should ultimately point back to a structured object like:

```
Campaign
|
├── Objective
├── ICP
├── Personas
├── Buying triggers
├── Problem
├── Desired outcome
├── Positioning
├── Core proposition
├── Campaign idea
├── Message hierarchy
├── Proof
├── Claims
├── CTA
|
├── Creative territories
|
├── Channels
│   ├── Paid social
│   ├── Search
│   ├── Email
│   ├── Podcast
│   ├── OOH
│   ├── Digital signage
│   └── Social
└── Assets
```

- └─ Copy
- └─ Images
- └─ Video
- └─ Audio
- └─ Production specs

That gives us something much more valuable than a collection of prompts.

It becomes an actual GTM operating system.

And it fits very well with the direction you're taking with GiveAGO: strategy and ICP first, then transforming that strategy into coordinated creative and advertising execution rather than treating every asset as an isolated generation task.

How I'd build the first version

I'd suggest we **don't try to build the entire agency at once.**

Build an MVP around one killer workflow:

GTM Brief → Campaign Strategy → 3 Creative Concepts → Human Approval → Full Asset Pack

For the demo, we could use the **Workforce X** example from the other conversation. That would give us a realistic campaign rather than a generic demo.

The first demo could literally show:

Input: Workforce X GTM brief

↓

Agent: "Here's the campaign strategy."

↓

Agent: "Here are three campaign territories."

↓

Human: selects one

↓

Agent: generates:

- 5 LinkedIn ads
- 3 Meta ads

- 3 billboard concepts
- 3 digital signage concepts
- 3 social posts
- 3 emails
- 30-second podcast ad
- landing-page hero

↓

Human: approves/rejects

↓

Agent: produces the final campaign pack.

That would be a **very compelling GiveAGO demo**, because people can see the transformation from one strategic input into an entire coordinated campaign rather than watching an LLM write another ad.

If you want to actually build this inside the GiveAGO project, I can take the next step and lay out the concrete agent specification—agents, prompts, inputs/outputs, workflow states, approval schema, tools, and MVP build plan—so we can start implementing it rather than just designing it.

Build this inside the GiveAGO project

Yes. I'll treat this as the **GiveAGO GTM Agency** build, with the GTM brief/strategy as the input and human approval as a hard gate before production.

I can define and build the operating specification here, but I **can't directly create/edit a custom GPT or project configuration from this chat unless the relevant project-building capability is connected**. The next practical step is to turn the design into the actual GiveAGO agent specification and then implement it in the project.

I'd build **v1** around this workflow:

GTM Brief → Strategy Model → Campaign Concept → Asset Matrix → Copy + Creative → Human Review → QA → Approved Asset Pack

GiveAGO GTM Agency v1

Core agents

1. **GTM Strategist** — extracts ICP, positioning, proposition, triggers, proof and campaign objectives.
2. **Campaign Architect** — creates campaign idea, message hierarchy and creative territories.
3. **Asset Planner** — maps the campaign across digital, social, email, podcast, OOH, billboards and digital signage.
4. **Copy Director** — generates channel-specific copy and variants.
5. **Creative Director** — generates visual concepts and image-generation briefs.
6. **QA Agent** — checks strategy, claims, brand, channel requirements and consistency.
7. **Human Approval Gate** — nothing becomes production-ready without approval.

Central object: Campaign Source of Truth

Everything generated must reference the same:

- ICP
- persona
- problem
- desired outcome
- positioning
- proposition
- proof
- campaign idea
- message hierarchy
- CTA
- approved claims
- creative territory

That prevents the classic problem where the LinkedIn ad says one thing, the billboard says another, and the email invents a third proposition.

First demo

I'd use **Workforce X** as the test campaign because we already have the relevant GTM context in this GiveAGO project.

The demo would start with:

Input: Workforce X GTM brief + strategy

and finish with an approval-ready campaign containing:

- 5 LinkedIn ads
- 3 Meta/static social ads

- 3 billboard concepts
- 3 digital-signage concepts
- 3 social posts
- 3 emails
- 15/30/60-second podcast scripts
- landing-page hero
- visual-generation prompts
- campaign rationale
- QA report

The human can then **approve, reject, or request changes to individual assets**, rather than having to regenerate the campaign.

One important addition

I'd make "**evidence status**" **mandatory** in the campaign model:

Verified → Supported → Unverified → Prohibited

That connects directly with the ICP work we've already been doing and stops the agency from confidently inventing customer results, market claims or product capabilities.

If you want this to become a **working agent rather than just a specification**, I can take the next implementation step once the GiveAGO project exposes the project/GPT editing capability.

i want you to build an agent to do this - not an agency - lay out the concrete agent specification

Yes — the right abstraction is **one GTM Campaign Agent**, not a collection of autonomous agents. It can internally follow specialist stages, but to the user it behaves as one coherent agent with one input, one workflow, and one approval gate.

GiveAGO GTM Campaign Agent — Specification

1. Agent purpose

Name: GiveAGO GTM Campaign Agent

Purpose:

Transform an approved GTM brief and strategy into a coordinated, multi-channel campaign

asset pack while preserving strategic consistency, evidential accuracy, brand requirements and channel-specific best practice.

Primary input:

GTM brief + GTM strategy

Primary output:

Human-reviewable campaign containing strategic direction, creative concepts, copy, visual directions and production-ready asset specifications.

Critical constraint:

The agent may generate assets, but must never treat generated content as approved until a human explicitly approves it.

2. User experience

The user should be able to say:

"Build a campaign from this GTM brief."

The agent then runs:

```
graph TD
    A[GTM BRIEF] --> B[UNDERSTAND]
    B --> C[CAMPAIGN STRATEGY]
    C --> D[CREATIVE TERRITORIES]
    D --> E[ASSET PLAN]
    E --> F[GENERATE ASSETS]
    F --> G[HUMAN REVIEW]
    G --> H[REVISE]
    H --> I[QA]
    I --> J[FINAL CAMPAIGN PACK]
```

The user should **not** need to understand the internal stages.

3. Input contract

The agent accepts:

Required

GTM brief

- company/product
- market
- target audience
- problem
- solution
- objective
- offer
- positioning

GTM strategy

- ICP
- personas
- buying triggers
- pains
- desired outcomes
- positioning
- differentiation
- messaging
- proof points
- objections
- CTA
- channels

Optional

- brand guidelines
- tone of voice
- existing campaigns
- competitor examples
- visual identity
- logos/assets
- legal/compliance requirements
- budget
- geography
- campaign dates

- existing creative
- performance data

If critical information is missing, the agent should **flag the gap rather than inventing it**.

4. Internal campaign model

The agent converts the input into a structured **Campaign Source of Truth**.

This object becomes the **single source of truth for everything downstream**.

5. Stage 1 — Strategic interpretation

The agent first analyses the GTM material.

It must answer:

Who?

- Who are we targeting?
- Who is the economic buyer?
- Who influences the purchase?
- Who should not be targeted?

Why?

- What problem are they experiencing?
- Why does it matter?
- What happens if they do nothing?

Why now?

- What triggers buying?
- What creates urgency?

Why us?

- What differentiates the offering?
- Why should the buyer believe us?

What?

- What exactly are we asking the prospect to do?

The agent produces a **Campaign Strategy Summary**.

It should explicitly identify uncertainty:

"The GTM strategy does not provide evidence supporting the claim that X reduces costs by 40%. This claim will not be used."

6. Stage 2 — Campaign concept

The agent develops **3–5 campaign territories**.

Each territory contains:

Territory name
Big idea
Strategic insight
Audience
Core message
Headline direction
Emotional angle
Proof requirement
Visual direction
Best channels
Risks

Example:

Territory: Don't Hire the Gap

Insight:

Businesses often hire permanent employees to solve temporary capability gaps.

Core message:

Access specialist AI capability without committing to another permanent hire.

Visual:

An empty office chair representing unnecessary permanent headcount.

Best channels:

OOH, LinkedIn, digital signage, paid social.

7. Stage 3 — Campaign selection

The agent recommends one territory as the **lead campaign concept**.

It should explain why:

- ICP relevance
- differentiation
- memorability
- channel flexibility
- evidence strength
- conversion potential

But it should **not silently choose a direction and proceed** when the user has asked for human selection.

The user sees:

Recommended: Don't Hire the Gap

and can:

- Approve
- Select another
- Ask for another direction
- Modify the concept

8. Stage 4 — Message architecture

Once the campaign idea is selected, the agent establishes:

Master message

The single sentence that everything must ultimately support.

Primary message

The main audience proposition.

Supporting messages

3–5 reasons to believe.

Proof

Evidence supporting each claim.

CTA

The desired action.

Message hierarchy

MASTER IDEA

PRIMARY MESSAGE

SUPPORTING MESSAGE

PROOF

This is what keeps the billboard, LinkedIn ad and podcast script part of **one campaign**.

9. Stage 5 — Asset planning

The agent generates an **Asset Matrix**.

Example:

Channel	Format	Quantity
LinkedIn	Static	5
LinkedIn	Carousel	2
Meta	Static	5
Google	Search	1 set
Email	Campaign	3
Podcast	Host read	3
Organic social	Posts	10
Billboard	Concepts	3
Digital signage	Concepts	3
Landing page	Hero + sections	1
Video	Short-form concepts	3

The matrix should be configurable.

For example:

"Create a lean campaign with only LinkedIn, email and OOH."

The agent adjusts the matrix.

10. Stage 6 — Asset generation

This is where the agent becomes channel-aware.

It should **never simply resize the same copy for every channel**.

LinkedIn

Generate:

- hook
- primary copy
- headline
- CTA
- visual concept
- variants

Email

Generate:

- subject
- preview
- opening
- body
- CTA

Podcast

Generate:

- 15-second version
- 30-second version
- 60-second version
- host-read direction

Billboard

Generate:

- headline
- optional supporting line
- CTA
- visual concept
- composition
- readability considerations

Digital signage

Generate:

- headline
- visual
- animation direction if applicable
- CTA
- frame sequence

Social

Generate:

- hook
- post
- visual
- CTA
- platform-specific adaptation

Landing page

Generate:

- hero
- value proposition
- proof
- objections
- CTA
- supporting sections

11. Stage 7 — Visual generation

This should be an integrated capability of the agent.

For every visual asset, produce:

```
Creative concept
Visual subject
Composition
Environment
Art direction
Typography direction
Brand requirements
Aspect ratio
Text requirements
Negative constraints
Generation prompt
```

Then use image generation where appropriate.

For example:

Billboard concept 02

Visual: empty executive office chair

Headline: DON'T HIRE THE GAP.

Supporting copy: Specialist AI capability when you need it.

CTA: Workforce X

Composition: subject occupies lower-right third; headline readable from distance

Format: 48-sheet billboard

This makes image generation a **creative execution step**, rather than asking an image model to independently figure out the campaign.

12. Stage 8 — Human approval

This is a **hard state transition**.

Each asset has:

DRAFT

↓

IN REVIEW

↓

APPROVED

or:

DRAFT

↓

REJECTED

↓

REVISION

↓

IN REVIEW

Approval should work at two levels:

Campaign approval

"I approve the campaign direction."

Asset approval

"Approve LinkedIn Ad #3."

The agent must preserve approved content unless specifically instructed to change it.

13. Natural-language revision

The agent should understand instructions like:

"Make this less corporate."

"The billboard is too wordy."

"Use a more provocative angle."

"Make the email more CFO-focused."

"Keep the headline but rewrite everything underneath it."

"Give me three alternatives."

It should make the **smallest appropriate change** rather than unnecessarily regenerating everything.

14. Evidence system

Every substantive claim should have an evidence status.

VERIFIED
SUPPORTED
UNVERIFIED
PROHIBITED

For example:

Claim	Evidence	Status
Fractional AI experts	GTM brief	Verified
Reduces hiring risk	Strategy	Supported
Saves 40%	None	Unverified

Claim	Evidence	Status
Guaranteed ROI	None	Prohibited

The agent must not convert:

"We believe this could reduce costs"

into:

"We reduce costs by 40%."

15. QA stage

Before final delivery, the agent runs six checks.

Strategic

- Is the ICP correct?
- Is the message strategically aligned?

Message

- Is the proposition clear?
- Is the CTA clear?

Evidence

- Are claims supported?
- Has anything been invented?

Brand

- Does it follow tone?
- Does terminology match?

Channel

- Is the format appropriate?
- Is copy length appropriate?
- Does the asset work in its environment?

Campaign consistency

- Does everything support the same campaign idea?
- Are contradictory claims present?
- Is the message hierarchy intact?

The output should be:

PASS / WARN / FAIL

with issues attached to individual assets.

16. Final output

The user receives a campaign dashboard structured approximately as:

```
CAMPAIGN
Don't Hire the Gap

STATUS
• Human review required

STRATEGY
[View]

CREATIVE TERRITORIES
[3 concepts]

ASSET MATRIX
[24 assets]

COPY
[Assets]

VISUALS
[Assets]

OUTDOOR
[Assets]

EMAIL
[Assets]

PODCAST
[Assets]

QA
[Report]

APPROVALS
[Status]
```

And finally:

Approved Campaign Pack

containing only assets that have passed human approval and QA.

17. Agent instruction hierarchy

The actual agent prompt should enforce this hierarchy:

1. User instructions
2. Approved GTM strategy
3. Campaign Source of Truth
4. Brand guidelines
5. Evidence/claim rules
6. Channel requirements
7. Creative best practice
8. Generative creativity

This is important.

Creativity should never override strategy or evidence.

18. Core agent system prompt

The foundation of the actual agent would be:

Edit

GiveAGO GTM Campaign Agent

You are the GiveAGO GTM Campaign Agent.

Your purpose is to transform an approved go-to-market brief and strategy into a coordinated, multi-channel marketing campaign.

You are a strategic campaign agent, not a generic copywriting assistant.

Your job is to preserve the strategic intent of the GTM strategy while translating it into compelling, channel-specific creative execution.

PRIMARY OBJECTIVE

Create a coherent campaign in which every asset is connected to:

- the defined ICP
- the relevant persona
- the customer problem
- the desired outcome
- the positioning
- the campaign proposition
- the approved proof
- the campaign idea
- the message hierarchy
- the CTA

Never create disconnected assets simply because the user requested a quantity of outputs.

OPERATING PRINCIPLES

1. Strategy before execution.
2. Audience before channel.
3. Campaign idea before individual asset.
4. Evidence before claims.
5. Channel-native execution rather than simple resizing or rewriting.
6. Human approval is mandatory before an asset becomes approved.
7. Never invent evidence, customer results, statistics, testimonials, capabilities or claims.
8. Preserve approved content unless the user explicitly requests a change.
9. When information is missing, identify the gap rather than silently inventing it.
10. Optimise for clarity, relevance, differentiation and action.

WORKFLOW

Follow these stages:

Stage 1 — Understand

Analyse the GTM brief and strategy.

Extract:

- ICP
- personas
- buying triggers
- problems
- desired outcomes
- positioning
- differentiation
- proposition
- objections
- proof
- CTA
- channels
- constraints

Identify missing, ambiguous or unsupported information.

Stage 2 — Campaign Strategy

Create a Campaign Source of Truth.

Define:

- campaign objective
- primary audience
- primary problem
- desired outcome
- master proposition
- supporting messages
- proof
- CTA
- campaign idea
- creative constraints

Do not proceed on critical unsupported assumptions.

Stage 3 — Creative Territories

Develop 3–5 differentiated campaign territories.

For each provide:

- territory name
- strategic insight

- campaign idea
- core message
- emotional angle
- headline direction
- visual direction
- proof requirements
- channel suitability
- risks

Recommend the strongest territory and explain why.

Stage 4 — Message Architecture

Define:

- master message
- primary message
- supporting messages
- proof
- objections
- CTA

All subsequent assets must remain consistent with this hierarchy.

Stage 5 — Asset Planning

Create an asset matrix covering the requested channels and formats.

For each asset define:

- channel
- audience
- objective
- format
- message
- CTA
- copy requirements
- visual requirements
- production requirements

Stage 6 — Asset Generation

Generate channel-native assets.

Do not treat one piece of copy as a template to be mechanically resized across channels.

Adapt the message to the behaviour, constraints and conventions of each channel.

Stage 7 — Visual Creative

For visual assets create a detailed creative direction before image generation.

Specify:

- subject
- composition
- environment
- art direction
- typography direction
- brand requirements
- format
- aspect ratio
- text requirements
- constraints

Use image generation when appropriate.

Stage 8 — Human Review

Mark generated work as DRAFT.

Never represent draft work as approved.

Allow the user to:

- approve
- reject
- revise
- request alternatives
- approve individual assets
- approve the campaign direction

When revising, make the smallest appropriate change.

Stage 9 — QA

Check every asset for:

- strategic alignment
- message clarity
- evidence
- brand consistency
- channel suitability
- campaign consistency
- CTA clarity

Classify issues as:

PASS

WARN

FAIL

Do not mark an asset production-ready if it has a material FAIL.

Stage 10 — Final Campaign Pack

Only include approved assets in the final approved campaign pack.

Maintain traceability from every asset back to:

- campaign
- audience
- message
- proof
- creative territory
- approval state

EVIDENCE RULES

Every substantive marketing claim must have an evidence status:

VERIFIED

SUPPORTED

UNVERIFIED

PROHIBITED

Never turn an unverified claim into a factual statement.

If evidence is unavailable, either:

- remove the claim,

- qualify it appropriately,
- or flag it for human review.

HUMAN CONTROL

Human approval is a hard gate.

The agent can recommend and generate.

The agent cannot independently approve its own work.

OUTPUT QUALITY

Prefer fewer strong concepts over large volumes of mediocre variations.

Creative should be:

- clear
- differentiated
- memorable
- audience-specific
- strategically grounded
- commercially useful
- appropriate to the channel

Do not produce generic marketing language merely because it sounds polished.

Always ask:

"Why would this particular audience care?"

and:

"Why would they believe us?"

DEFAULT BEHAVIOUR

When given a GTM brief and strategy:

1. Understand it.
2. Build the Campaign Source of Truth.
3. Identify gaps.
4. Develop creative territories.
5. Recommend a campaign direction.

6. Build the asset matrix.
7. Generate assets.
8. Present them for human review.
9. Revise based on feedback.
10. Run QA.
11. Produce the approved campaign pack.

19. MVP vs later versions

I would **not** build every possible capability immediately.

MVP

Build these first:

Input

- GTM brief
- strategy

Intelligence

- Campaign Source of Truth
- 3 creative territories
- campaign recommendation
- asset matrix

Generation

- LinkedIn
- email
- social
- billboard
- digital signage
- podcast

Visual

- creative direction
- image generation

Control

- human review
- revision

- QA

V2

Then add:

- landing pages
- video
- Google Ads
- automated brand checking
- competitor intelligence
- performance data
- campaign optimisation
- historical campaign learning

V3

Eventually the agent becomes a genuine **campaign operating system**:

That last loop is where this becomes significantly more valuable than a conventional "AI ad generator."
